**CROSS-REFERENCE TO RELATED
APPLICATIONS**

This application is a national stage application under 35 U.S.C. §371 of International Patent Application No. PCT/US2013/042065, filed on May 21, 2013, which claims priority to U.S. Provisional Patent Application No. 61/650,113, filed May 22, 2012 each of these applications are hereby incorporated herein by reference in their entirety.

TECHNICAL FIELD

This invention relates to the field of molecular biology and medicine.

BACKGROUND

Endothelial cells line blood vessels and lymph vessels, and remain in a quiescent state until inflammatory cues in underlying tissues cause them to become activated. Endothelial cell activation consists of changes in morphology, as well as gene expression. Activated endothelial cells promote vascular/lymphatic vessel fluid leakage and the extravasation of leukocytes from the lumen of blood and lymph vessels to adjoining tissues. The extravasation of leukocytes from the lumen of blood and lymph vessels into an adjoining tissue is induced by the expression of leukocyte adhesion molecules in activated endothelial cells that line lymph and blood vessels. The expression of leukocyte adhesion molecules in these activated endothelial cells promotes the rolling of leukocytes in the blood or lymph vessel, firm adhesion of leukocytes within the blood or lymph vessel, and finally, extravasation of leukocytes out of the blood or lymph vessels and into the adjoining tissue.

Increased extravasation of leukocytes and blood/lymph vessel fluid leakage plays a role in inflammation, inflammatory disorders, and vessel (blood and lymph vessel) fluid leakage disorders. For example, increases in endothelial cell adhesion molecule expression and leukocyte extravasation are associated with several inflammatory disorders, including cardiovascular disease and atherosclerosis. Conversely, loss of endothelial cell adhesion molecules can cause one to be immune-compromised, thus illustrating the important role for endothelial cells in the promotion of inflammation, and the maintenance of vascular and lymphatic homeostasis.

Models of inflammation in murine animal models are well documented. Mice lacking the leukocyte adhesion molecules intercellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), and E- or P-selectin (or combinations thereof) display reduced levels of acute inflammation. Furthermore, mice lacking apolipoprotein E (ApoE) or low-density lipoprotein (LDL) receptors, which are prone to atherosclerosis, display reduced atherosclerosis when these leukocyte adhesion molecules are absent.

SUMMARY

The inventions described herein are based, at least in part, on the discovery that oligonucleotides that decrease the expression of Mitogen-activated protein kinase kinase kinase kinase 4 (Map4k4) mRNA in an endothelial cell reduce the induction of leukocyte adhesion molecules in

2

endothelial cells and also reduce endothelial cell monolayer permeability. In view of these discoveries, provided herein are methods of decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal that include or consist of administering to the mammal an oligonucleotide that decreases Map4k4 mRNA expression in an endothelial cell. Also provided are methods of decreasing fluid leakage from a lymph or blood vessel in a mammal, methods of decreasing the formation of atherosclerotic plaques in a blood vessel in a mammal in need thereof, and methods of treating a mammal having atherosclerosis that include or consist of administering to the mammal an oligonucleotide that decreases Map4k4 mRNA expression in an endothelial cell, and screening methods for identifying a candidate agent useful for decreasing leukocyte extravasation or decreasing fluid leakage from a lymph or blood vessel in a mammal. Compositions containing an oligonucleotide that decreases Map4k4 mRNA expression in an endothelial cell and one or more cholesterol-improving agents are also provided.

Provided herein are methods of decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal in need thereof that include or consist of administering to the mammal an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to decrease expression of leukocyte adhesion molecules in endothelial cells lining blood or lymph vessels, thereby decreasing extravasation of leukocytes from the lymph or blood vessel into a tissue in a mammal. In some embodiments, the mammal has been diagnosed as having acute inflammation, chronic inflammation, atherosclerosis, or an autoimmune disease. In some embodiments, the administration of the oligonucleotide results in treatment of acute inflammation, chronic inflammation, atherosclerosis, or the autoimmune disease. In some embodiments, the oligonucleotide is administered by intravenous or intraarterial administration. In some embodiments, the leukocyte is a monocyte, a T-lymphocyte, an eosinophil, a basophil, a neutrophil, or a B-lymphocyte.

Also provided are methods of decreasing fluid leakage from a lymph or blood vessel in a mammal in need thereof that include or consist of administering to the mammal an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, where the oligonucleotide is administered in an amount sufficient to decrease fluid leakage from a lymph or blood vessel in the mammal. In some embodiments, the mammal has been diagnosed as having acute inflammation, chronic inflammation, lymphedema, edema, or an autoimmune disease. In some embodiments, the administration results in treatment of acute inflammation, chronic inflammation, lymphedema, edema, or the autoimmune disease. In some embodiments, the oligonucleotide is administered by intravenous or intraarterial administration.

Also provided herein are methods of reducing formation of atherosclerotic plaques in a blood vessel in a mammal in need thereof that include or consist of administering to the mammal an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to decrease expression of leukocyte adhesion molecules in endothelial cells lining blood or lymph vessels, thereby reducing formation of atherosclerotic plaques in a blood vessel in a

mammal. In some embodiments, the mammal has been diagnosed as having atherosclerosis. In some embodiments, the administration of the oligonucleotide results in treatment of atherosclerosis. In some embodiments, the oligonucleotide is administered by intravenous or intraarterial administration.

Also provided herein are methods of treating atherosclerosis in a mammal that include or consist of administering to the mammal an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to treat atherosclerosis in a mammal. In some embodiments, the mammal has been diagnosed as having atherosclerosis. In some embodiments, the oligonucleotide is administered by intravenous or intraarterial administration.

In some embodiments of any of the methods described herein, the mammal is a human. In some embodiments of any of the methods described herein, the oligonucleotide is an inhibitory RNA (e.g., a small inhibitory RNA). In some embodiments of any of the above methods described herein, the oligonucleotide is an antisense oligonucleotide. In some embodiments of any of the methods described herein, the oligonucleotide is a ribozyme. In some embodiments of any of the methods described herein, the oligonucleotide is administered in a liposome or a nanoparticle.

Also provided are methods of identifying a candidate agent useful for decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal or decreasing fluid leakage from a lymph or blood vessel in a mammal. These methods include or consist of providing a mammalian endothelial cell, contacting the mammalian endothelial cell with a candidate agent, determining a test level of Map4k4 expression in the mammalian endothelial cell, comparing the test level of Map4k4 expression in the mammalian endothelial cell to a reference level of Map4k4 expression in a control mammalian endothelial cell untreated with the candidate agent, and identifying a candidate agent that results in a test level of Map4k4 expression that is lower than the reference level of Map4k4 expression as being useful for decreasing leukocyte extravasation or fluid leakage from a lymph or blood vessel into a tissue in a mammal.

In some embodiments, the mammalian endothelial cell is in vitro. In some embodiments, the mammalian cell is in a mammal. In some embodiments, Map4k4 expression is Map4k4 protein expression. In some embodiments, Map4k4 expression is Map4k4 mRNA expression.

Also provided are compositions that include or consist of an oligonucleotide selected from the group of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell; and one or more cholesterol-improving therapeutic agents (e.g., a statin, gemfibrozil, or fenofibrate). In some embodiments, the composition is formulated for intraarterial or intravenous administration. In some embodiments, the composition is formulated in a liposome or a nanoparticle.

Also provided herein are methods of using an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell in the manufacture of a medicament for treating inflammation, or treating an inflammatory disorder, e.g., atherosclerosis or psoriasis, or a vessel fluid leakage disorder in a mammal.

Also provided herein are oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell for use in treating inflammation, or treating an inflammatory disorder or a vessel fluid leakage disorder in a mammal.

Also provided herein are methods of using an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell in the manufacture of a medicament for decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal (e.g., a human) in need thereof.

Also provided herein are oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell for use in decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal (e.g., a human) in need thereof.

Also provided herein are methods of using an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell in the manufacture of a medicament for reducing the formation of atherosclerotic plaques in a blood vessel in a mammal in need thereof and/or treating atherosclerosis in a mammal (e.g., a human).

Also provided herein are oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell for use in reducing the formation of atherosclerotic plaques in a blood vessel in a mammal in need thereof and/or treating atherosclerosis in a mammal (e.g., a human).

Also provided herein are methods of using an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell in the manufacture of a medicament for decreasing fluid leakage from a lymph or blood vessel in a mammal (e.g., a human) in need thereof.

Also provided herein are oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell for use in decreasing fluid leakage from a lymph or blood vessel in a mammal (e.g., a human) in need thereof.

By the term "extravasation" is meant the migration of a mammalian leukocyte from the interior (lumen) of a blood or lymph vessel into a tissue surrounding the blood or lymph vessel in a mammal. In some embodiments, the mammalian leukocyte that migrates from the interior of a blood or lymph vessel into a surrounding tissue is a monocyte, a T-lymphocyte, an eosinophil, a basophil, a neutrophil, or a B-lymphocyte.

By the phrase "decrease expression" is meant a reduction in the level of a specific protein or a reduction in the level of an mRNA encoding a specific protein in a mammalian cell (e.g., a mammalian endothelial cell) upon contacting the endothelial cell with an agent (e.g., an oligonucleotide that decreases Map4k4 mRNA expression in an endothelial cell) as compared to a control endothelial cell not contacted with the agent. In some embodiments, a level of a Map4k4 protein or an mRNA encoding a Map4k4 protein (a Map4k4 mRNA) is reduced in a mammalian endothelial cell. In some embodiments, a level of one or more leukocyte adhesion molecules or one or more mRNAs encoding a leukocyte adhesion molecule is reduced in a mammalian endothelial cell.

By the term "leukocyte adhesion molecule" is meant a protein (e.g., a glycoprotein) expressed on the surface of a mammalian endothelial cell lining a blood or lymph vessel that is specifically recognized and bound by a protein present (expressed) on the surface of a leukocyte (e.g., any of the leukocytes described herein). Non-limiting examples of leukocyte adhesion molecules include ICAM-1, VCAM-1, and E-selectin.

By the term "fluid leakage" is meant the escape of blood or plasma from a mammalian blood vessel or the escape of lymph from a mammalian lymph vessel.

By the term "Map4k4 protein" or "Mitogen-activated protein kinase kinase kinase 4 protein" is meant an endogenous mammalian Map4k4 protein. In some embodi-

5

ments, the Map4k4 protein is a human Map4k4 protein (e.g., SEQ ID NO: 1, 3, 5, 7, or 9). Additional examples of Map4k4 protein are described herein.

By the term “Map4k4 mRNA” or “Mitogen-activated protein kinase kinase kinase kinase 4 mRNA” is meant an endogenous messenger RNA that encodes a mammalian Map4k4 protein. In some embodiments, the Map4k4 mRNA is a human Map4k4 mRNA (e.g., SEQ ID NO: 2, 4, 6, 8, or 10).

By the term “cholesterol-improving therapeutic agent” is meant a pharmaceutical agent that mediates a decrease in the level of low density lipoprotein (LDL), a decrease in the level of total cholesterol (high density lipoprotein (HDL)+LDL+other lipid components), and/or an increase in the level of HDL in a mammal. In some embodiments, the cholesterol-improving therapeutic agent is a statin, gemfibrozil, or fenofibrate.

The term “reducing the formation of atherosclerotic plaques” means causing a decrease in the development of new atherosclerotic plaques over time and/or causing a decrease in the rate of expansion of one or more pre-existing atherosclerotic plaques in a mammal (e.g., a human) following the administration of a treatment as compared to a control mammal (e.g., a human) that is not administered the same treatment or receives a placebo. For example, the mammal that receives the treatment can have the same disease (e.g., atherosclerosis) as the control mammal. For example, the mammal that receives the treatment can be a human diagnosed with atherosclerosis, and the control mammal (e.g., human) can also be diagnosed with atherosclerosis. In other examples, the mammal (e.g., human) that receives that treatment can be identified as having an increased risk of developing atherosclerosis, and the control mammal (e.g., human) can also be identified as having an increased risk of developing atherosclerosis.

Other definitions appear in context throughout this disclosure. Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Methods and materials are described herein for use in the present invention; other, suitable methods and materials known in the art can also be used. The materials, methods, and examples are illustrative only and not intended to be limiting. All publications, patent applications, patents, sequences, database entries, and other references mentioned herein are incorporated by reference in their entirety. In case of conflict, the present specification, including definitions, will control.

Other features and advantages of the invention will be apparent from the following detailed description and figures, and from the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an image of a section of a Western blot of proteins immunoprecipitated from human umbilical vein endothelial cells (HUVECs) using an antibody against human Map4k4 protein (bottom row), and a section of a polyacrylamide gel showing the phosphorylation (P^{32}) of myelin basic protein (MBP) following incubation of MBP substrate and P^{32} -ATP with human Map4k4 immunoprecipitated from HUVECs (bottom row). In each experiment, the HUVECs were either untreated or treated with 10 ng/mL TNF α for up to 60 minutes before lysis and immunoprecipitation with the anti-human Map4k4 antibody.

FIG. 2 is a graph showing the fold-increase in the mRNA levels of different genes in HUVECs transfected with 25 nM

6

scrambled or Map4k4 siRNA, following treatment with 10 ng/mL TNF α as compared to the same cells untreated with TNF α .

FIG. 3 is a graph showing the normalized level of Map4k4 mRNA expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment with TNF α or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 4 is a graph showing the normalized level of ICAM-1 mRNA expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment with TNF α or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 5 is a graph showing the normalized level of VCAM-1 mRNA expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment with TNF α or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 6 is a graph showing the normalized level of E-selectin mRNA expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment with TNF α or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 7 is an immunoblot showing the level of Map4k4, ICAM-1, VCAM-1, E-selectin, and VE-cadherin protein expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment with TNF α or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 8 is a graph showing the normalized level of ICAM-1 protein expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 9 is a graph showing the normalized level of VCAM-1 protein expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 10 is a graph showing the normalized level of E-selectin protein expression in HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment or treatment with 10 ng/mL TNF α for 3 or 6 hours.

FIG. 11 is a graph showing the fold change in the adhesion of THP-1 monocytes, a monocyte cell line that can differentiate into macrophage-like cells, to HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment or treatment with 10 ng/mL TNF α for 3 or 6 hours (relative to the level of adhesion of THP-1 monocytes to HUVECs transfected with 25 nM scrambled siRNA, and not treated with TNF α).

FIG. 12 is a schematic showing the construct used to generate mice with reduced endothelial cell Map4k4 expression (endothelial Map4k4 knock-down mice).

FIG. 13 shows the normalized level of Map4k4 mRNA expression in primary mouse lung endothelial cells and primary mouse lung fibroblasts isolated from control (a mouse containing a control transgene in which the shRNA that decreases Map4k4 expression is not expressed) and endothelial Map4k4 knock-down mice.

FIG. 14 is a Western blot showing the levels of Map4k4, VEGFR2, and tubulin protein expression in primary mouse lung endothelial cells and primary mouse lung fibroblasts isolated from control and endothelial Map4k4 knock-down mice.

FIG. 15 is a graph showing the normalized levels of Map4k4 protein expression in primary mouse lung endothelial cells and primary mouse lung fibroblasts isolated from control and endothelial Map4k4 knock-down mice.

FIG. 16 is a graph showing the normalized level of ICAM-1 mRNA expression in primary mouse lung endothe-

lial cells isolated from control and endothelial Map4k4 knock-down mice following no treatment or treatment with 10 ng/mL TNF α for 6 hours.

FIG. 17 is a graph showing the normalized level of VCAM-1 mRNA expression in primary mouse lung endothelial cells isolated from control and endothelial Map4k4 knock-down mice following no treatment or treatment with 10 ng/mL TNF α for 6 hours.

FIG. 18 is a graph showing the normalized level of E-selectin mRNA expression in primary mouse lung endothelial cells isolated from control and endothelial Map4k4 knock-down mice following no treatment or treatment with 10 ng/mL TNF α for 6 hours.

FIG. 19 is a graph showing the normalized level of P-selectin mRNA expression in primary mouse lung endothelial cells isolated from control and endothelial Map4k4 knock-down mice following no treatment or treatment with 10 ng/mL TNF α for 6 hours.

FIG. 20 is a graph showing the migration of FITC-labeled dextran (average fluorescence units) through a monolayer of HUVECs transfected with 25 nM scrambled or Map4k4 siRNA, following no treatment or overnight treatment with 10 ng/mL TNF α .

FIG. 21 is a graph showing the glucose levels in control (Sh) and endothelial Map4k4 knock-down (Sh cre) mice following a chow or a high fat diet (HFD) for 17 weeks (post-weaning), fasting overnight, and injection with 1 g/kg glucose. The data shown are the glucose levels in the control and endothelial knock-down mice at 0, 15, 30, 60, 90, and 120 minutes after injection with 1 g/kg glucose. The data represent the mean \pm standard error of the mean (n=6-11). The area under the curve was quantitated in Graph Pad Prism and subjected to student's t-test. The asterisk represents p<0.05.

FIG. 22 is a light microscope image of an aorta from a ApoE $^{-/-}$ (control) mouse (left image) and a light microscope image of an aorta from a ApoE $^{-/-}$ /Map4k4 knock-down mice (right image) that were fed a Western diet for 8 weeks. The arrows indicate atherosclerotic plaques.

FIG. 23 is an Oil-Red O-stained aortic root section from a ApoE $^{-/-}$ (control) mouse (left panel) and an Oil-Red-O stained aortic root section from a ApoE $^{-/-}$ /Map4k4 knock-down mouse (right panel) that were fed a Western diet for 8 weeks. The arrows indicate atherosclerotic plaques.

FIG. 24 is a graph showing the mean percentage aortic root area of atherosclerotic lesions (plaques) present in ApoE $^{-/-}$ (control) mice and ApoE $^{-/-}$ /Map4k4 known-down mice that were fed a Western diet for 8 weeks, as determined using Oil-Red-O staining and ImageJ software. The mean data are shown (n=3), with a p<0.05 (*).

FIG. 25 is a light microscope en face image of an aorta stained with Oil-Red-O from an ApoE $^{-/-}$ (control) mouse (left image) and a light microscope en face image of an aorta stained with Oil-Red-O from an ApoE $^{-/-}$ /Map4k4 known-down mouse (right image) that were fed a Western diet for 8 weeks.

FIG. 26 is a graph showing the mean percentage aortic root area of atherosclerotic lesions (plaques) present in the en face light microscope images from ApoE $^{-/-}$ (control) mice or ApoE $^{-/-}$ /Map4k4 known-down mice that were fed a Western diet for 8 weeks, as determined using Oil-Red-O staining and ImageJ software. The mean data are shown (n=5-6), with a p<0.05 (*).

DETAILED DESCRIPTION

The inventions described herein are based, at least in part, on the discovery that decreasing Map4k4 expression in

endothelial cells results in a decrease in the expression of several different leukocyte adhesion molecules, and results in a decrease in the permeability of endothelial cell monolayers. Thus, provided herein are methods of decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal and methods of decreasing fluid leakage from a lymph or blood vessel in a mammal that include or consist of administering an oligonucleotide that decreases the level of Map4k4 mRNA in an endothelial cell.

Also provided are methods of identifying candidate agents that are useful for decreasing leukocyte extravasation from a lymph or blood vessel in a mammal or decreasing fluid leakage from a lymph or blood vessel in a mammal. The screening methods include, inter alia, contacting an endothelial cell with a candidate agent and determining the level of Map4k4 expression in the endothelial cell.

Also provided are compositions that contain or consist of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell and a cholesterol-improving therapeutic agent. Various, non-limiting features of each aspect of the invention are described below.

Map4k4

Mitogen-activated protein kinase kinase kinase 4 (Map4k4; also known as NCK-interacting Kinase, or NIK) is a serine/threonine kinase that regulates diverse signaling pathways and is essential for mammalian development (Xue et al., *Development*, 128(9):1559-1572, 2001). The N-terminus of the human Map4k4 polypeptide has a catalytic kinase domain with 11 kinase subdomains (Yao et al., *J. Biol. Chem.*, 274: 2118-2125, 1999).

Non-limiting examples of Map4k4 proteins are endogenous Map4k4 proteins, e.g., an endogenous human Map4k4 protein (e.g., a Map4k4 protein containing the sequence of SEQ ID NO: 1, 3, 5, 7, or 9) and an endogenous dog Map4k4 protein (e.g., SEQ ID NO: 11). In some embodiments, an endogenous form of Map4k4 protein contains a sequence that is at least 80% identical (e.g., at least 85%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% identical) to SEQ ID NO: 1, 3, 5, 7, 9, or 11. A number of additional endogenous mammalian forms of Map4k4 protein are known in the art.

Examples of Map4k4 proteins include for example, the following proteins: human Map4k4 protein isoform 1 (SEQ ID NO: 1), human Map4k4 protein isoform 2 (SEQ ID NO: 3), human Map4k4 protein isoform 3 (SEQ ID NO: 5), human Map4k4 protein isoform 4 (SEQ ID NO: 7), human Map4k4 protein isoform 5 (SEQ ID NO: 9), and dog Map4k4 protein (SEQ ID NO: 11).

Non-limiting examples of Map4k4 cDNA that encode human and dog Map4k4 protein are: human Map4k4 isoform 1 cDNA (SEQ ID NO: 2), human Map4k4 isoform 2 cDNA (SEQ ID NO: 4), human Map4k4 isoform 3 cDNA (SEQ ID NO: 6), human Map4k4 isoform 4 cDNA (SEQ ID NO: 8), human Map4k4 isoform 5 cDNA (SEQ ID NO: 10), and dog Map4k4 cDNA (SEQ ID NO: 12). In some embodiments, the Map4k4 mRNA contains a sequence that is at least 80% identical (e.g., at least 85%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% identical) to SEQ ID NO: 2, 4, 6, 8, 10, or 12. Additional examples of Map4k4 mRNA that encode other endogenous forms of mammalian Map4k4 protein are known in the art.

Methods of Decreasing Leukocyte Extravasation and Decreasing Vessel Fluid Leakage

Also provided are methods of decreasing leukocyte extravasation from a lymph or blood vessel in a mammal in need thereof, that include or consist of administering to the mammal an oligonucleotide that decreases Map4k4 mRNA

expression in an endothelial cell, in an amount sufficient to decrease expression of leukocyte adhesion molecules in endothelial cells lining blood or lymph vessels; thereby decreasing extravasation of leukocytes from the lymph or blood vessel into a tissue in a mammal.

In addition, methods of decreasing fluid leakage from a lymph or blood vessel in a mammal are provided that include or consist of administering to the mammal an oligonucleotide that decreases Map4k4 mRNA expression in an endothelial cell, where the oligonucleotide is administered in an amount sufficient to decrease fluid leakage from a lymph or blood vessel in the mammal.

In some embodiments of all the methods described herein, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is "synthetic," i.e., is synthesized in vitro. In some embodiments of all the methods described herein, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell includes or consists of one or more (e.g., at least 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, or 26) modified nucleotides (e.g., one or more different types of modified nucleotides known in the art or described herein).

In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is a small inhibitory or interfering RNA (e.g., siRNA), an anti-sense oligonucleotide, or a ribozyme (e.g., any of the oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell described herein).

In some embodiments, the mammal (e.g., human) has been previously diagnosed or is suspected of having inflammation (e.g., acute inflammation or chronic inflammation) or an inflammatory disorder (e.g., atherosclerosis or an autoimmune disease). Non-limiting examples of autoimmune diseases include acute disseminated encephalomyelitis, acute necrotizing hemorrhagic leukoencephalitis, Addison's disease, alopecia areata, amyloidosis, ankylosing spondylitis, nephritis, autoimmune angioedema, autoimmune hepatitis, autoimmune inner ear disease, autoimmune myocarditis, autoimmune pancreatitis, autoimmune retinopathy, autoimmune thrombocytopenic purpura, autoimmune thyroid disease, autoimmune urticarial, axonal and neuronal neuropathies, Behcet's disease, Bullous pemphigoid, cardiomyopathy, Celiac disease, Chagas disease, chronic inflammatory demyelinating polyneuropathy, chronic recurrent multifocal osteomyelitis, cicatricial pemphigoid/benign mucosal pemphigoid, Crohn's disease, demyelinating neuropathies, dermatomyositis, endometriosis, eosinophilic fascitis, erythema nodosum, experimental allergic encephalomyelitis, fibrosing alveolitis, giant cell arteritis (temporal arteritis), glomerulonephritis, Goodpasture's syndrome, Graves' disease, Guillain-Barre syndrome, Hashimoto's encephalitis, Hashimoto's thyroiditis, IgA nephropathy, IgG4-related sclerosing disease, inclusion body myositis, interstitial cystitis, juvenile arthritis, leukocytoclastic vasculitis, ligneous conjunctivitis, mixed connective tissue disease, multiple sclerosis, myositis, ocular cicatricial pemphigoid, optic neuritis, palindromic rheumatism, *pemphigus*, peripheral neuropathy, perivenous encephalomyelitis, type I, II, and III autoimmune polyglandular syndromes, polymyalgia rheumatic, polymyositis, postmyocardial infarction syndrome, postpericardiotomy syndrome, progesterone dermatitis, primary biliary cirrhosis, primary sclerosing cholangitis, psoriasis, psoriatic arthritis, idiopathic pulmonary fibrosis, pyoderma gangrenosum, pure red cell aplasia, rheumatoid arthritis, sarcoidosis, scleritis, *scleroderma*, sperm and testicular autoimmunity, Takayasu's arteritis,

temporal arteritis/Giant cell arteritis, thrombocytopenic purpura (TTP), transverse myelitis, ulcerative colitis, undifferentiated connective tissue disease (UCTD), uveitis, vasculitis, vesiculobullous dermatosis, vitiligo, and Wegener's granulomatosis. In some embodiments, the mammal (e.g., human) has been previously diagnosed or is suspected of having lymphedema or edema.

A mammal can be diagnosed as having inflammation or an inflammatory disorder by a medical or veterinary professional by interviewing (when the mammal is a human) and/or physically examining the mammal. In some embodiments, a medical professional may diagnose a human as having inflammation or an inflammatory disorder by the observation of one or more symptoms of inflammation or an inflammatory disorder in a mammal. The symptoms experienced by a mammal will depend on the specific inflammatory disorder. For example, non-limiting examples of symptoms of an autoimmune disease include fever, hair loss, skin rash, skin bruising, skin ulcers, dry eyes, blurred vision, dry mouth, hoarseness, difficulty swallowing, fatigue, muscle weakness, joint stiffness, swelling in hands and feet, significant weight loss or gain, nausea, vomiting, diarrhea, irritability, lack of coordination, unsteady gait, numbness in one or more limbs, tremor, increased thirst, loss of appetite, amenorrhea, shortness of breath, tightness in chest, high cholesterol levels, unexplained anemia, and alteration in blood sugar levels (hypoglycemia or hyperglycemia).

Non-limiting symptoms of atherosclerosis include chest pain (angina), sudden numbness or weakness in arms or legs, difficulty speaking or slurred speech, drooping facial muscles, and leg pain (intermittent claudication). Non-limiting examples of symptoms of lymphedema include swelling in at least part of an arm or leg, a feeling of heaviness or tightness in an arm or leg, restricted range of motion in an arm or leg, aching or discomfort in an arm or leg, recurring infections in a limb, and hardening or thickening of the skin of an arm or leg. Non-limiting symptoms of edema include swelling or puffiness of the tissue under the skin, stretched or shiny skin, skin that retains a dimple after being pressed for several seconds, and increased abdominal size.

A decrease in leukocyte extravasation in a mammal can be indicated by a decrease in one or more of the symptoms of inflammation or an inflammatory disorder in a mammal (e.g., any of the symptoms described herein). A decrease in leukocyte extravasation in a mammal can also be indicated by a decrease in the pain, swelling, or redness in an affected tissue. In some embodiments, a decrease in leukocyte extravasation in a mammal is indicated by a decrease in the levels of one or more pro-inflammatory mediators secreted by activated leukocytes (e.g., a decrease in the level of one or more cytokines, e.g., TNF α , IL-6, IL-1, IL-8, and IL-2, in the mammal). A decrease in fluid leakage of a lymph or blood vessel can be indicated by a decrease in the swelling, a decrease in the pain or loss of motion in a limb, or a decrease in the abnormal accumulation of blood, plasma, or lymph in a tissue (e.g., a limb).

The mammal may be female or male, and may be an adult or juvenile (e.g., an infant). The mammal may have been previously treated with another anti-inflammatory or cholesterol-improving therapeutic agent. The mammal may have been diagnosed or be suspected of having inflammation (e.g., acute inflammation or chronic inflammation) or an inflammatory disorder (e.g., atherosclerosis or an autoimmune disease). The mammal may have been diagnosed or be suspected of having lymphedema or edema. The mammal may also have a sibling, parent, or grandparent with elevated

11

levels of LDL or elevated levels of total cholesterol. The mammal may have a body mass index (BMI) of between 25 to 30, or a BMI of greater than 30. The mammal may have an elevated level of triglycerides. The mammal may also have a sibling, parent, or grandparent that has had a heart attack or stroke. Where the mammal is an adult, the mammal may be, e.g., between 18 to 20 years old or at least or about 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, or at least or about 100 years old.

The oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell may be administered by intravenous, intraarterial, subcutaneous, intraperitoneal, intramuscular, ocular, or intrathecal administration. In some instances, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered by local administration to an inflamed tissue or a locus of the pain in the mammal. In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is directly injected into a blood vessel or lymph vessel in the mammal. In other instances, the oligonucleotide that decreases the expression of Map4k4 mRNA is systemically delivered to the mammal. Combinations of such treatments are contemplated by the present invention.

The oligonucleotide that decreases Map4k4 mRNA in an endothelial cell can be administered by a medical professional (e.g., a physician, a physician's assistant, a nurse, a nurse's assistant, or a laboratory technician) or veterinary professional. Alternatively or in addition, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be self-administered by a human, e.g., the patient her/himself. The oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be administered in a hospital, a clinic, or a primary care facility (e.g., a nursing home), or any combination thereof.

The appropriate amount (dosage) of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell administered can be determined by a medical professional or a veterinary professional based on a number of factors including, but not limited to, the route of administration, the severity of inflammation, the mammal's responsiveness to other anti-inflammatory agents, the health of the mammal, the mammal's mass, the other therapies administered to the mammal, the age of the mammal, the sex of the mammal, and any other co-morbidity present in the mammal.

A medical professional or veterinary professional having ordinary skill in the art can readily determine the effective amount of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell that is required. For example, a physician or veterinarian could start with doses of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., any of the oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell described herein) at levels lower than that required to achieve the desired therapeutic effect and then gradually increase the dose until the desired effect is achieved.

In some embodiments, the mammal is administered a dose of between 1 mg to 500 mg of any of the oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell described herein (e.g., between 1 mg to 400 mg, between 1 mg to 300 mg, between 1 mg and 250 mg, between 1 mg and 200 mg, between 1 mg and 150 mg, between 1 mg and 100 mg, between 1 mg and 50 mg, between 5 mg and 50 mg, between 5 mg and 50 mg, and between 5 mg and 40 mg).

In some embodiments, the mammal is further administered an anti-inflammatory agent, an analgesic, and/or a

12

cholesterol-improving therapeutic agent (e.g., any of the anti-inflammatory agents, analgesics, and/or cholesterol-improving therapeutic agents described herein). In some embodiments, the mammal is administered a dose of between 1 mg to 500 mg (e.g., each) of an anti-inflammatory agent, an analgesic, and/or a cholesterol-improving therapeutic agent (e.g., between 1 mg to 400 mg, between 1 mg to 300 mg, between 1 mg and 250 mg, between 1 mg and 200 mg, between 1 mg and 150 mg, between 1 mg and 100 mg, between 1 mg and 50 mg, between 5 mg and 50 mg, between 5 mg and 40 mg, between 20 mg and 400 mg, between 20 mg and 300 mg, between 50 mg and 300 mg, and between 50 mg and 200 mg). The anti-inflammatory agent, analgesic, and/or cholesterol-improving therapeutic agent can be administered to the mammal at substantially the same time as the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell.

Alternatively or in addition, the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent may be administered to the mammal at one or more time points other than the time point at which the oligonucleotide that decreases the expression of Map4k4 mRNA is administered. In some embodiments, the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent is formulated together with an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., using any of the examples of formulations and compositions described herein).

In some embodiments, the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated in a second dosage form. In some embodiments where the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA is formulated in a second dosage form, the first dosage form and the second dosage form can be formulated for the same route of administration (e.g., oral, subcutaneous, intramuscular, intravenous, intraarterial, intrathecal, and intraperitoneal administration) or can be formulated for different routes of administration (e.g., the first dosage form formulated for oral administration and the second dosage form formulated for subcutaneous administration). Combinations of such treatment regimes are clearly contemplated in the present invention.

The amount of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (and optionally, an anti-inflammatory agent, an analgesic, and/or a cholesterol-improving therapeutic agent) administered will depend on whether the administration is local or systemic. In some embodiments, the mammal is administered more than one dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell. In some embodiments, the mammal is administered more than one dose of any of the compositions described herein. In some embodiments, the mammal is administered a dose of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell at least once a month (e.g., at least twice a month, at least three times a month, at least four times a month, at least once a week, at least twice a week, three times a week, once a day, or twice a day).

In some embodiments, an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered to a mammal chronically. In some embodiments, any of the compositions described herein is admin-

istered to the mammal chronically. Chronic treatments include any form of repeated administration for an extended period of time, such as repeated administrations for one or more months, between a month and a year, one or more years, or longer. In some embodiments, chronic treatments can involve regular administrations, for example one or more times a day, one or more times a week, or one or more times a month. In general, a suitable dose such as a daily dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell will be the amount of the oligonucleotide that is the lowest dose effective to produce a desired therapeutic effect. Such an effective dose will generally depend upon the factors described herein. If desired, the effective daily dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be administered as two, three, four, five, or six or more sub-doses administered separately at appropriate intervals throughout the day, optionally, in unit dosage forms.

In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated for sustained-release (e.g., formulated in a biodegradable polymer or a nanoparticle). In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered locally to the site of pain or inflammation in the mammal. In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered systemically (e.g., oral, intravenous, intraarterial, intraperitoneal, intramuscular, or subcutaneous administration). In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated for oral, intraglandular, periglandular, subcutaneous, interductal, intramuscular, intraperitoneal, intramuscular, intraarterial, transdermal, interlymphatic, or intravenous administration).

Methods of Treating Inflammation, Inflammatory or Vessel Fluid Leakage Disorders, and Decreasing Atherosclerotic Plaque Formation

Also provided herein are methods of treating inflammation (e.g., acute or chronic inflammation), an inflammatory disorder (e.g., any of the inflammatory diseases described herein) or atherosclerosis), or a vessel fluid leakage disorder (e.g., lymphedema or edema), and methods of reducing the formation of atherosclerotic plaques in a blood vessel (e.g., an artery) in a mammal in need thereof. These methods include or consist of administering to a mammal in need thereof an oligonucleotide that decreases the expression of a Map4k4 mRNA in an endothelial cell (e.g., any of the oligonucleotides that decrease the expression of a Map4k4 mRNA in an endothelial cell described herein) in an amount sufficient to treat inflammation, the inflammatory disorder (e.g., atherosclerosis), or the vessel fluid leakage disorder in the mammal, or in an amount sufficient to decrease expression of leukocyte adhesion molecules in endothelial cells lining blood or lymph vessels.

In some embodiments of all the methods described herein, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is "synthetic," i.e., is synthesized in vitro. In some embodiments of all the methods described herein, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell includes or consists of one or more (e.g., at least 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, or 26) modified nucleotides (e.g., one or more different types of modified nucleotides known in the art or described herein).

In some embodiments, the mammal has been previously diagnosed or is suspected of having inflammation (e.g., acute or chronic inflammation). In some embodiments, the mammal is identified as having an increased risk of developing atherosclerosis. In some embodiments, the mammal has been previously diagnosed or is suspected of having an inflammatory disorder (e.g., an autoimmune disease (e.g., any of the autoimmune disorders described herein) or atherosclerosis). In some embodiments, the mammal has been previously diagnosed or is suspected of having a vessel fluid leakage disorder (e.g., lymphedema or edema). The mammal may be female or male, and may be an adult or juvenile (e.g., an infant). Where the mammal is an adult, the mammal may be, e.g., between 18 to 20 years old or at least or about 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, or at least or about 100 years old.

A mammal can be diagnosed as having inflammation (e.g., chronic or acute inflammation), an inflammatory disorder (e.g., atherosclerosis), or a vessel fluid leakage disorder by a medical profession by observation of one or more symptoms in the mammal (e.g., one or more of any of the symptoms of inflammation, an inflammatory disorder, or a vessel fluid leakage disorder described herein or known in the art). In some embodiments, the mammal may already be receiving a treatment for inflammation, an inflammatory disorder (e.g., atherosclerosis), or a vessel fluid leakage disorder. In some embodiments, the prior treatment for inflammation, an inflammatory disorder (e.g., atherosclerosis), or a vessel fluid leakage disorder has been unsuccessful.

The oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell may be administered by intravenous, intraarterial, subcutaneous, intraperitoneal, interlymphatic, intramuscular, ocular, or intrathecal administration. The oligonucleotide can be formulated using any of the examples of techniques described herein (e.g., formulated for subcutaneous, intravenous, intraarterial, interlymphatic, or intrathecal administration, and/or formulated in a liposome or nanoparticle).

The oligonucleotide that decreases Map4k4 mRNA in an endothelial cell can be administered by a medical professional (e.g., a physician, a physician's assistant, a nurse, a nurse's assistant, or a laboratory technician) or veterinary professional. Alternatively or in addition, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be self-administered by a human, e.g., the patient her/himself. The oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be administered in a hospital, a clinic, or a primary care facility (e.g., a nursing home), or any combination thereof.

In some embodiments, the mammal is administered a dose of between 1 mg to 500 mg of any of the oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial cell described herein (e.g., using any of the doses, formulations, and routes of administration described herein).

Successful treatment of inflammation or an inflammatory disorder (e.g., atherosclerosis) can be indicated by a decrease in the number or the severity or frequency of one or more of the symptoms of inflammation or an inflammatory disorder in a mammal (e.g., any of the symptoms described herein). Successful treatment of inflammation or an inflammatory disorder can also indicated by a decrease in the pain, swelling, or redness in an affected tissue. In some embodiments, successful treatment of inflammation or an inflammatory disorder in a mammal can be indicated by a decrease in the levels of one or more inflammatory mediators secreted by activated leukocytes in the mammal (e.g., a

15

decrease in the level of one or more cytokines, e.g., TNF α , IL-6, IL-1, IL-8, and IL-2). Successful treatment of a vessel fluid leakage disorder can be indicated by a decrease in the swelling, a decrease in the pain or loss of motion in a limb, or a decrease in the abnormal accumulation of blood, plasma, or lymph in a tissue (e.g., a limb).

In another example, successful treatment of the inflammatory disorder of atherosclerosis can be observed by a decrease in the number, frequency, and/or duration of one or more symptoms of atherosclerosis in the mammal (e.g., chest pain (angina), sudden numbness or weakness in arms or legs, shortness of breath, arrhythmia, dizziness, sudden and severe headache, sleep problems, fatigue, difficulty speaking or slurred speech, confusion, drooping facial muscles, detection of a bruit, and leg pain (intermittent claudication)). Successful treatment of atherosclerosis can also be detected using imaging (e.g., Doppler tests using ultrasound or sound waves, magnetic resonance arteriography, CT angiography, arteriograms, and/or angiography). A reduction in the formation of atherosclerotic plaques in a mammal can be detected by a decrease in the number, frequency, and/or duration of one or more symptoms of atherosclerosis in the mammal (e.g., chest pain (angina), sudden numbness or weakness in arms or legs, shortness of breath, arrhythmia, dizziness, sudden and severe headache, sleep problems, fatigue, difficulty speaking or slurred speech, confusion, drooping facial muscles, detection of a bruit, and leg pain (intermittent claudication)), a decrease in the rate of the development of new symptoms of atherosclerosis (e.g., any of those symptoms described herein), or a decrease in the rate of worsening of one or more symptoms of atherosclerosis (e.g., any of the symptoms described herein) in a mammal (e.g., a human) receiving any of the treatments described herein, as compared to a control mammal (e.g., a human) having atherosclerosis but receiving a different treatment or a placebo. A reduction in the formation of atherosclerotic plaques in a mammal (e.g., a human) over time can also be detected using periodic imaging (e.g., Doppler tests using ultrasound or sound waves, magnetic resonance arteriography, CT angiography, arteriograms, and/or angiography). For example, the rate of formation of atherosclerotic plaques in a mammal (e.g., a human) receiving any of the treatments described herein can be detected over time at two or more time points (e.g., using any of the imaging techniques described herein), and the changes in atherosclerotic plaques over time in the mammal (e.g., human) receiving the treatment can be compared to the changes in atherosclerotic plaques over a similar time frame in a control mammal (e.g., a human) receiving a different treatment or a placebo. In these examples, the mammal that is administered a treatment as described herein and the control mammal can have the same disease (e.g., atherosclerosis), the same risk of disease (e.g., increased risk of developing atherosclerosis), or be diagnosed with the same disease (e.g., atherosclerosis). A mammal can be identified as having an increased risk of developing atherosclerosis using methods known in the art. For example, one or more of the following indicates that a mammal has an increased risk of developing atherosclerosis: high LDL level, low HDL level, current smoking habit, high blood pressure (e.g., 140/90 or greater), diagnosed with diabetes, and family history of heart attacks.

In some embodiments, the mammal is further administered an anti-inflammatory agent, an analgesic, and/or a cholesterol-improving therapeutic agent (e.g., any of the cholesterol-improving agents described herein). In some embodiments, the mammal is further administered an anti-

16

inflammatory agent, an analgesic, and/or a cholesterol-improving therapeutic agent using any of the dosages, formulations, and routes of administration described herein. The anti-inflammatory agent, analgesic, and/or cholesterol-improving therapeutic agent can be administered to the mammal at substantially the same time as the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell.

Alternatively or in addition, the anti-inflammatory agent, 10 the analgesic, and/or the cholesterol-improving therapeutic agent may be administered to the mammal at one or more time points other than the time point at which the oligonucleotide that decreases the expression of Map4k4 mRNA is administered. In some embodiments, the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent is formulated together with an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., using any of the examples of formulations and compositions described herein). In some 15 embodiments, the anti-inflammatory agent, the analgesic, and the cholesterol-improving therapeutic agent are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated in a second dosage form. In some 20 embodiments where the anti-inflammatory agent, the analgesic, and/or the cholesterol-improving therapeutic agent are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA is formulated in a second dosage form, the first dosage form and the 25 second dosage form can be formulated for the same route of administration (e.g., oral, subcutaneous, intramuscular, intravenous, intaarterial, intrathecal, interlymphatic, and intraperitoneal administration) or can be formulated for 30 different routes of administration (e.g., the first dosage form formulated for oral administration and the second dosage form formulated for subcutaneous administration). Combinations of such treatment regimes are clearly contemplated in the present invention.

In some embodiments where arteriosclerosis is treated in 40 a mammal, the mammal is further administered one or more additional agents useful for treating atherosclerosis selected from the group of: an anti-inflammatory agent, an analgesic, a cholesterol-improving therapeutic agent (e.g., a statin), a fibrate (e.g., gemfibrozil or fenofibrate), nicotinic acid, bile 45 acid sequestrants (e.g., cholestyramine, colestipol, and colesevexam), omega-3 oil supplement (Lovaza or Vascepa), and/or an anti-platelet drug or blood thinner (e.g., aspirin, clopidogrel, ticagrelor, prasugrel, and warfarin) using any of the dosages, formulations, and routes of administration 50 described herein. The anti-inflammatory agent, the analgesic, the cholesterol-improving therapeutic agent, the fibrate, the nicotinic acid, the bile acid sequestrant, the omega-3 oil supplement, and/or the anti-platelet drug or blood thinner 55 can be administered to the mammal at substantially the same time as the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell.

Alternatively or in addition, the anti-inflammatory agent, the analgesic, the cholesterol-improving therapeutic agent, the fibrate, the nicotinic acid, the bile acid sequestrant, the omega-3 oil supplement, and/or the anti-platelet drug or blood thinner may be administered to the mammal at one or 60 more time points other than the time point at which the oligonucleotide that decreases the expression of Map4k4 mRNA is administered. In some embodiments, the anti-inflammatory agent, the analgesic, the cholesterol-improving therapeutic agent, the fibrate, the nicotinic acid, the bile acid sequestrant, the omega-3 oil supplement, and/or the 65

anti-platelet drug or blood thinner is formulated together with an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., using any of the examples of formulations and compositions described herein).

In some embodiments, the anti-inflammatory agent, the analgesic, the cholesterol-improving therapeutic agent, the fibrate, the nicotinic acid, the bile acid sequestrant, the omega-3 oil supplement, and/or the anti-platelet drug or blood thinner are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated in a second dosage form. In some embodiments where the anti-inflammatory agent, the analgesic, the cholesterol-improving therapeutic agent, the fibrate, the nicotinic acid, the bile acid sequestrant, the omega-3 oil supplement, and/or the anti-platelet drug or blood thinner are formulated in a first dosage form, and the oligonucleotide that decreases the expression of Map4k4 mRNA is formulated in a second dosage form, the first dosage form and the second dosage form can be formulated for the same route of administration (e.g., oral, subcutaneous, intramuscular, intravenous, intraarterial, intrathecal, interlymphatic, and intraperitoneal administration) or can be formulated for different routes of administration (e.g., the first dosage form formulated for oral administration and the second dosage form formulated for subcutaneous administration). Combinations of such treatment regimes are clearly contemplated in the present invention.

The amount of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (and optionally, an anti-inflammatory agent, an analgesic, and/or a cholesterol-improving therapeutic agent) administered will depend on whether the administration is local or systemic. In some embodiments, the mammal is administered more than one dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell. In some embodiments, the mammal is administered more than one dose of any of the compositions described herein. In some embodiments, the mammal is administered a dose of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell at least once a month (e.g., at least twice a month, at least three times a month, at least four times a month, at least once a week, at least twice a week, three times a week, once a day, or twice a day).

In some embodiments, an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered to a mammal chronically. In some embodiments, any of the compositions described herein is administered to the mammal chronically. Chronic treatments include any form of repeated administration for an extended period of time, such as repeated administrations for one or more months, between a month and a year, one or more years, or longer. In some embodiments, chronic treatments can involve regular administrations, for example one or more times a day, one or more times a week, or one or more times a month. In general, a suitable dose such as a daily dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell will be the amount of the oligonucleotide that is the lowest dose effective to produce a desired therapeutic effect. Such an effective dose will generally depend upon the factors described herein. If desired, the effective daily dose of the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be administered as two, three, four, five, or six

or more sub-doses administered separately at appropriate intervals throughout the day, optionally, in unit dosage forms.

In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated for sustained-release (e.g., formulated in a biodegradable polymer or a nanoparticle). In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial is formulated in a nanoparticle as described in U.S. Patent Application Serial Nos. WO 2010/042555, WO 2011/084620, and WO 2012/040623. In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered locally to the site of pain, inflammation, edema, or lymphedema in the mammal. In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is administered systemically (e.g., oral, intravenous, intraarterial, intraperitoneal, intramuscular, interlymphatic, or subcutaneous administration). In some embodiments, the oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell is formulated for oral, intraglandular, periglandular, subcutaneous, interductal, intramuscular, intraperitoneal, intramuscular, intraarterial, transdermal, interlymphatic, or intravenous administration). Oligonucleotides that Decrease the Expression of Map4k4 mRNA

Non-limiting examples of oligonucleotides that can decrease the expression of Map4k4 mRNA in a mammalian endothelial cell include inhibitory nucleic acids (e.g., small inhibitory nucleic acids (siRNA)), antisense oligonucleotides, and ribozymes. Exemplary aspects of these different oligonucleotides are described below. Any of the examples of oligonucleotides that can decrease expression of Map4k4 mRNA in an endothelial cell can be synthetic, i.e., can be synthesized *in vitro*.

Antisense Oligonucleotides

Oligonucleotides that decrease the expression of Map4k4 mRNA expression in a mammalian endothelial cell include antisense nucleic acid molecules, i.e., nucleic acid molecules whose nucleotide sequence is complementary to all or part of an mRNA based on the sequence of a gene encoding a Map4k4 protein (e.g., complementary to all or a part of SEQ ID NO: 2, 4, 6, 8, 10, or 12). An antisense nucleic acid molecule can be antisense to all or part of a non-coding region of the coding strand of a nucleotide sequence encoding a Map4k4 protein. Non-coding regions (5' and 3' untranslated regions) are the 5' and 3' sequences that flank the coding region in a gene and are not translated into amino acids.

Based upon the sequences disclosed herein, one of skill in the art can easily choose and synthesize any of a number of appropriate antisense molecules to target a Map4k4 gene described herein. For example, a “gene walk” comprising a series of oligonucleotides of 15-30 nucleotides spanning the length of a Map4k4 gene can be prepared, followed by testing for inhibition of expression of the Map4k4 gene. Optionally, gaps of 5-10 nucleotides can be left between the oligonucleotides to reduce the number of oligonucleotides synthesized and tested. Antisense oligonucleotides targeting Map4k4 can also be designed using the software available at the Integrated DNA Technologies website.

An antisense oligonucleotide can be, for example, about 5, 10, 15, 20, 25, 30, 35, 40, 45, or 50 nucleotides or more in length. An antisense nucleic acid can be constructed using chemical synthesis and enzymatic ligation reactions using procedures known in the art. For example, an antisense

19

nucleic acid (e.g., an antisense oligonucleotide) can be chemically synthesized using naturally occurring nucleotides or variously modified nucleotides designed to increase the biological stability of the molecules or to increase the physical stability of the duplex formed between the antisense and sense nucleic acids, e.g., phosphorothioate derivatives and acridine substituted nucleotides can be used.

Examples of modified nucleotides which can be used to generate the antisense nucleic acid include 5-fluorouracil, 5-bromouracil, 5-chlorouracil, 5-iodouracil, hypoxanthine, xanthine, 4-acetylcytosine, 5-(carboxyhydroxymethyl) uracil, 5-carboxymethylaminomethyl-2-thiouridine, 5-carboxymethylaminomethyluracil, dihydrouracil, beta-D-galactosylqueosine, inosine, N6-isopentenyladenine, 1-methylguanine, 1-methylinosine, 2,2-dimethylguanine, 2-methyladenine, 2-methylguanine, 3-methylcytosine, 5-methylcytosine, N6-adenine, 7-methylguanine, 5-methylaminomethyluracil, 5-methoxyaminomethyl-2-thiouracil, beta-D-mannosylqueosine, 5'-methoxycarboxymethyluracil, 5-methoxyuracil, 2-methylthio-N6-isopentenyladenine, uracil-5-oxyacetic acid (v), wybutoxosine, pseudouracil, queosine, 2-thiocytosine, 5-methyl-2-thiouracil, 2-thiouracil, 4-thiouracil, 5-methyluracil, uracil-5-oxyacetic acid methylester, uracil-5-oxyacetic acid (v), 5-methyl-2-thiouracil, 3-(3-amino-3-N-2-carboxypropyl) uracil, (acp3)w, and 2,6-diaminopurine. Alternatively, the antisense nucleic acid can be produced biologically using an expression vector into which a nucleic acid has been subcloned in an antisense orientation (i.e., RNA transcribed from the inserted nucleic acid will be of an antisense orientation to a target nucleic acid of interest, described further in the following subsection).

The antisense nucleic acid molecules described herein can be prepared in vitro and administered to a mammal, e.g., a human. Alternatively, they can be generated in situ such that they hybridize with or bind to cellular mRNA and/or genomic DNA encoding a Map4k4 protein to thereby inhibit expression, e.g., by inhibiting transcription and/or translation. The hybridization can be by conventional nucleotide complementarities to form a stable duplex, or, for example, in the case of an antisense nucleic acid molecule that binds to DNA duplexes, through specific interactions in the major groove of the double helix. An example of a route of administration of antisense nucleic acid molecules includes direct injection at a tissue site. Alternatively, antisense nucleic acid molecules can be modified to target selected cells and then administered systemically. For example, for systemic administration, antisense molecules can be modified such that they specifically bind to receptors or antigens expressed on a selected cell surface, e.g., by linking the antisense nucleic acid molecules to peptides or antibodies that bind to cell surface receptors or antigens. The antisense nucleic acid molecules can also be delivered to cells using the vectors described herein. For example, to achieve sufficient intracellular concentrations of the antisense molecules, vector constructs can be used in which the antisense nucleic acid molecule is placed under the control of a strong pol II or pol III promoter. In some embodiments, the vector used to express the oligonucleotide that decreases the expression of Map4k4 mRNA in a mammalian fibroblast can be a lentivirus, a retrovirus, or an adenovirus vector.

An antisense nucleic acid molecule of the invention can be an α -anomeric nucleic acid molecule. An α -anomeric nucleic acid molecule forms specific double-stranded hybrids with complementary RNA in which, contrary to the usual, β -units, the strands run parallel to each other (Gaultier et al., *Nucleic Acids Res.* 15:6625-6641, 1987). The anti-

20

sense nucleic acid molecule can also comprise a 2'-O-methylribonucleotide (Inoue et al., *Nucleic Acids Res.*, 15:6131-6148, 1987) or a chimeric RNA-DNA analog (Inoue et al., *FEBS Lett.*, 215:327-330, 1987).

Antisense molecules that are complementary to all or part of a Map4k4 gene are also useful for assaying expression of a Map4k4 gene using hybridization methods known in the art. For example, the antisense molecule is labeled (e.g., with a radioactive molecule) and an excess amount of the labeled antisense molecule is hybridized to an RNA sample. Unhybridized labeled antisense molecule is removed (e.g., by washing) and the amount of hybridized antisense molecule measured. The amount of hybridized molecule is measured and used to calculate the amount of expression of the Map4k4 mRNA. In general, antisense molecules used for this purpose can hybridize to a sequence from a Map4k4 gene under high stringency conditions such as those described herein. When the RNA sample is first used to synthesize cDNA, a sense molecule can be used. It is also possible to use a double-stranded molecule in such assays as long as the double-stranded molecule is adequately denatured prior to hybridization.

Non-limiting examples of antisense oligonucleotides that decrease Map4k4 mRNA expression in an endothelial cell include: CTTCTCCACTCTCTCCCACA (SEQ ID NO: 13), CCTCTCTTCTCACTCCCCAC (SEQ ID NO: 14), CTTCTCCACTCTCTCCCAC (SEQ ID NO: 15), GCT-TCTCCACTCTCTCCCAC (SEQ ID NO: 16), and GCT-TCTCCACTCTC TCCCACA (SEQ ID NO: 17). All antisense sequences are predicted to bind within the 1000-3000 bp region of the Map4k4 gene sequence.

Ribozymes

Also provided are ribozymes that have specificity for sequences encoding a Map4k4 protein described herein (e.g., specificity for a Map4k4 mRNA, e.g., specificity for SEQ ID NO: 2, 4, 6, 8, 10, or 12). Ribozymes are catalytic RNA molecules with ribonuclease activity that are capable of cleaving a single-stranded nucleic acid, such as an mRNA, to which they have a complementary region. Thus, ribozymes (e.g., hammerhead ribozymes (described in Haselhoff and Gerlach, *Nature*, 334:585-591, 1988)) can be used to catalytically cleave mRNA transcripts to thereby inhibit translation of the protein encoded by the mRNA. A ribozyme having specificity for a nucleic acid molecule of the invention can be designed based upon the nucleotide sequence of a cDNA disclosed herein. For example, a derivative of a Tetrahymena L-19 IVS RNA can be constructed in which the nucleotide sequence of the active site is complementary to the nucleotide sequence to be cleaved in a Map4k4 mRNA (Cech et al. U.S. Pat. No. 4,987,071; and Cech et al., U.S. Pat. No. 5,116,742). Alternatively, a Map4k4 mRNA can be used to select a catalytic RNA having a specific ribonuclease activity from a pool of RNA molecules. See, e.g., Bartel and Szostak, *Science*, 261:1411-1418, 1993.

Also provided herein are nucleic acid molecules that form triple helical structures. For example, expression of a Map4k4 polypeptide can be inhibited by targeting nucleotide sequences complementary to the regulatory region of the gene encoding the Map4k4 polypeptide (e.g., the promoter and/or enhancer, e.g., a sequence that is at least 1 kb, 2 kb, 3 kb, 4 kb, or 5 kb upstream of the transcription initiation start site) to form triple helical structures that prevent transcription of the gene in target cells. See generally Helene, *Anticancer Drug Des.* 6(6):569-84, 1991; Helene, *Ann. N.Y. Acad. Sci.*, 660:27-36, 1992; and Maher, *Bioassays*, 14(12):807-15, 1992.

In various embodiments, nucleic acid molecules (e.g., nucleic acid molecules used to decrease expression of Map4k4 mRNA in a mammalian fibroblast) can be modified at the base moiety, sugar moiety, or phosphate backbone to improve, e.g., the stability, hybridization, or solubility of the molecule. For example, the deoxyribose phosphate backbone of the nucleic acids can be modified to generate peptide nucleic acids (see Hyrup et al., *Bioorganic & Medicinal Chem.*, 4(1): 5-23, 1996). Peptide nucleic acids (PNAs) are nucleic acid mimics, e.g., DNA mimics, in which the deoxyribose phosphate backbone is replaced by a pseudopeptide backbone and only the four natural nucleobases are retained. The neutral backbone of PNAs allows for specific hybridization to DNA and RNA under conditions of low ionic strength. The synthesis of PNA oligomers can be performed using standard solid phase peptide synthesis protocols, e.g., as described in Hyrup et al., 1996, *supra*; Perry-O'Keefe et al., *Proc. Natl. Acad. Sci. USA*, 93: 14670-675, 1996.

PNAs can be used in therapeutic and diagnostic applications. For example, PNAs can be used as antisense or antigene agents for sequence-specific modulation of gene expression by, e.g., inducing transcription or translation arrest or inhibiting replication. PNAs can also be used, e.g., in the analysis of single base pair mutations in a gene by, e.g., PNA directed PCR clamping; as artificial restriction enzymes when used in combination with other enzymes, e.g., S1 nucleases (Hyrup, 1996, *supra*; or as probes or primers for DNA sequence and hybridization (Hyrup, 1996, *supra*; Perry-O'Keefe et al., *Proc. Natl. Acad. Sci. USA*, 93: 14670-675, 1996).

PNAs can be modified, e.g., to enhance their stability or cellular uptake, by attaching lipophilic or other helper groups to PNA, by the formation of PNA-DNA chimeras, or by the use of liposomes or other techniques of drug delivery known in the art. For example, PNA-DNA chimeras can be generated which may combine the advantageous properties of PNA and DNA. Such chimeras allow DNA recognition enzymes, e.g., RNase H and DNA polymerases, to interact with the DNA portion while the PNA portion would provide high binding affinity and specificity. PNA-DNA chimeras can be linked using linkers of appropriate lengths selected in terms of base stacking, number of bonds between the nucleobases, and orientation (Hyrup, 1996, *supra*). The synthesis of PNA-DNA chimeras can be performed as described in Hyrup, 1996, *supra*, and Finn et al., *Nucleic Acids Res.*, 24:3357-63, 1996. For example, a DNA chain can be synthesized on a solid support using standard phosphoramidite coupling chemistry and modified nucleoside analogs. Compounds such as 5'-*(4-methoxytrityl)amino*-5'-deoxy-thymidine phosphoramidite can be used as a link between the PNA and the 5' end of DNA (Mag et al., *Nucleic Acids Res.*, 17:5973-88, 1989). PNA monomers are then coupled in a stepwise manner to produce a chimeric molecule with a 5' PNA segment and a 3' DNA segment (Finn et al., *Nucleic Acids Res.*, 24:3357-63, 1996). Alternatively, chimeric molecules can be synthesized with a 5' DNA segment and a 3' PNA segment (Peterser et al., *Bioorganic Med. Chem. Lett.*, 5:1119-1124, 1975).

In some embodiments, the oligonucleotide includes other appended groups such as peptides (e.g., for targeting host cell receptors *in vivo*), or agents facilitating transport across the cell membrane (see, e.g., Letsinger et al., *Proc. Natl. Acad. Sci. USA*, 86:6553-6556, 1989; Lemaitre et al., *Proc. Natl. Acad. Sci. USA*, 84:648-652, 1989; WO 88/09810) or the blood-brain barrier (see, e.g., WO 89/10134). In addition, oligonucleotides can be modified with hybridization-triggered cleavage agents (see, e.g., Krol et al., *Bio/Tech-*

niques, 6:958-976, 1988) or intercalating agents (see, e.g., Zon, *Pharm. Res.*, 5:539-549, 1988). To this end, the oligonucleotide may be conjugated to another molecule, e.g., a peptide, hybridization triggered cross-linking agent, transport agent, hybridization-triggered cleavage agent, etc.

siRNA

Another means by which expression of a Map4k4 mRNA can be decreased in mammalian endothelial cells is by RNA interference (RNAi). RNAi is a process in which mRNA is degraded in host cells. To inhibit an mRNA, double-stranded RNA (dsRNA) corresponding to a portion of the gene to be silenced (e.g., a gene encoding a Map4k4 polypeptide) is introduced into a cell. The dsRNA is digested into 21-23 nucleotide-long duplexes called short interfering RNAs (or siRNAs), which bind to a nuclease complex to form what is known as the RNA-induced silencing complex (or RISC). The RISC targets the homologous transcript by base pairing interactions between one of the siRNA strands and the endogenous mRNA. It then cleaves the mRNA about 12 nucleotides from the 3' terminus of the siRNA (see Sharp et al., *Genes Dev.* 15:485-490, 2001, and Hammond et al., *Nature Rev. Gen.*, 2:110-119, 2001).

RNA-mediated gene silencing can be induced in mammalian cells in many ways, e.g., by enforcing endogenous expression of RNA hairpins (see, Paddison et al., *Proc. Natl. Acad. Sci. USA*, 99:1443-1448, 2002) or, as noted above, by transfection of small (21-23 nt) dsRNA (reviewed in Caplen, *Trends in Biotech.*, 20:49-51, 2002). Methods for modulating gene expression with RNAi are described, e.g., in U.S. Pat. No. 6,506,559 and U.S. Patent Publication No. 2003/0056235, which are hereby incorporated by reference.

Standard molecular biology techniques can be used to generate siRNAs. Short interfering RNAs can be chemically synthesized, recombinantly produced, e.g., by expressing RNA from a template DNA, such as a plasmid, or obtained from commercial vendors such as Dharmacon. The RNA used to mediate RNAi can include synthetic or modified nucleotides, such as phosphorothioate nucleotides. Methods of transfecting cells with siRNA or with plasmids engineered to make siRNA are routine in the art.

The siRNA molecules used to decrease expression of a Map4k4 mRNA can vary in a number of ways. For example, they can include a 3' hydroxyl group and strands of 21, 22, or 23 consecutive nucleotides. They can be blunt ended or include an overhanging end at either the 3' end, the 5' end, or both ends. For example, at least one strand of the RNA molecule can have a 3' overhang from about 1 to about 6 nucleotides (e.g., 1-5, 1-3, 2-4 or 3-5 nucleotides (whether pyrimidine or purine nucleotides) in length. Where both strands include an overhang, the length of the overhangs may be the same or different for each strand.

To further enhance the stability of the RNA duplexes, the 3' overhangs can be stabilized against degradation (by, e.g., including purine nucleotides, such as adenosine or guanosine nucleotides or replacing pyrimidine nucleotides by modified analogues (e.g., substitution of uridine 2 nucleotide 3' overhangs by 2'-deoxythymidine is tolerated and does not affect the efficiency of RNAi). Any siRNA can be used in the methods of decreasing Map4k4 mRNA, provided it has sufficient homology to the target of interest (e.g., a sequence present in SEQ ID NO: 2, 4, 6, 8, 10, or 12). There is no upper limit on the length of the siRNA that can be used (e.g., the siRNA can range from about 21 base pairs of the gene to the full length of the gene or more (e.g., 50-60, 60-70, 70-80, 80-90, or 90-100 base pairs).

Non-limiting examples of siRNAs that can be used to decrease Map4k4 mRNA expression in an endothelial cell

23

include: TGCTGTCTGGTGAAGAAITTA (SEQ ID NO: 18), GACCAACTCTGGCTTGTTAT (SEQ ID NO: 19), CAGAAGTGGCCAAGGGAAA (SEQ ID NO: 20), AGAAGAAGGTGCA GGTTTA (SEQ ID NO: 21), AGA-GAAG GCAATAGAGATA (SEQ ID NO: 22), GCTTACATCTCCAGGGAAA (SEQ ID NO: 23). SiRNAs that can be used to decrease the expression of Map4k4 mRNA in an endothelial cell can also be purchased from Dharmacon (e.g., SEQ ID NO: 19).

Compositions and Kits

Oligonucleotides that decrease the expression of Map4k4 mRNA in an endothelial can be used to treat or prevent the development of atherosclerosis in a mammal (e.g., a human). Provided herein are compositions that contain an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., any of the oligonucleotides that decrease expression of Map4k4 mRNA in an endothelial cell described herein) and one or more of a cholesterol-improving therapeutic agent (e.g., any of the exemplary cholesterol-improving therapeutic agents described herein or known in the art), a fibrate, a nicotinic acid, a bile acid sequestrant, an omega-3 oil supplement, and/or an anti-platelet drug or blood thinner. Such compositions can be useful for treating or reducing the rate of development of atherosclerosis or reducing the formation of atherosclerotic plaques in a blood vessel in a mammal. In some embodiments, the composition can contain one or more of: a pharmaceutically acceptable excipient or buffer, an antimicrobial or antifungal agent, or a stabilizing protein (e.g., human serum albumin).

In some embodiments, the cholesterol-improving therapeutic agent is an agent that decreases the level of LDL in a mammal, increases the level of HDL in a mammal, or decreases the total cholesterol level in a mammal. In some embodiments, the cholesterol-improving therapeutic agent is a statin (e.g., lovastatin, atorvastatin, rosuvastatin, sitagliptin, simvastatin, fluvastatin, atorvastatin, pitavastatin, and pravastatin), gemfibrozil, fenofibrate, niacin, cholestyramine, colestipol, clofibrate, ezetimibe, and amiodipine.

In some embodiments, the compositions can further include one or more of an anti-inflammatory agent and/or an analgesic. Non-limiting examples of anti-inflammatory agents include corticosteroids, non-steroidal anti-inflammatory drugs (NSAIDs, e.g., cyclooxygenase I (COX I) inhibitors and cyclooxygenase II (COX-II) inhibitors), immune selective anti-inflammatory derivatives (ImSAIDs), and biologics. Non-limiting examples of NSAIDs that can be salicylates (e.g., aspirin, diflusinal, and salsalate), propionic acid derivatives (e.g., ibuprofen, dexibuprofen, naproxen, fenoprofen, ketoprofen, dexketoprofen, flurbiprofen, oxaprozin, and loxoprofen), acetic acid derivatives (e.g., indomethacin, sulindac, etodolac, ketorolac, diclofenac, and nabumetone), enolic acid derivatives (e.g., piroxicam, meloxicam, tanoxicam, droxicam, lornoxicam, and isoxicam), fenamic acid derivatives (e.g., mefamic acid, meclofenamic acid, flufenamic acid, and tolafenamic acid), sulphonanilides (e.g., nimesulide), licofelone, and lysine clonixinate. In some embodiments, an NSAID is a COX-I inhibitor or a COX-II inhibitor. Non-limiting examples of COX-I inhibitors include aspirin, ibuprofen, and naproxen. Non-limiting examples of COX-II inhibitors include celecoxib, valdecoxib, and rofecoxib. Non-limiting examples of ImSAIDs include FEG (Phe-Glu-Gly), its D-isomer feG, and SGP-T peptide. Non-limiting examples of corticosteroids include hydrocortisone, cortisone acetate, tixocortal pivalate, prednisolone, methylprednisolone, prednisone, tri-

24

amcinolone acetonide, triamcinolone alcohol, mometasone, amcinonide, budenoside, desonide, fluocinolone, halcinonide, betamethasone, dexamethasone, and fluocortolone. Non-limiting examples of biologics include tocilizumab, certolizumab, etanercept, adalimumab, anakinra, abatacept, efalizumab, infliximab, rituximab, and golimumab. Non-limiting examples of analgesics include opioid drugs (e.g., morphine, opium, codeine, oxycodone, hydrocodone, diamorphine, dihydromorphine, pethidine, buprenorphine, and tramadol), paracetamol, acetaminophen, venlafaxine, flupirtine, nefopam, gabapentin, orphenadrine, cyclobenzaprine, trazodone, gabapentin, clonidine, fentanyl, methadone, meperidine, pentazocine, dextromoramide, dipipanone, and amitriptyline.

Any of the compositions described herein can be formulated as a liquid for systemic administration. In some embodiments, the compositions are formulated for intraarterial, intravenous, interlymphatic, intraperitoneal, intrathecal, ocular, nasal, intramuscular, intraductal, or subcutaneous administration.

In some embodiments, the compositions are formulated as a solid. In some embodiments, the compositions are formulated for oral or topical (e.g., transdermal) administration. In some embodiments, the compositions are formulated as a suppository.

In some embodiments, the compositions are encapsulated in nanomaterials for targeted delivery (e.g., encapsulated in a nanomaterial having one or more tissue- or cell-targeting molecules on its surface). For example, the compositions can be encapsulated in nanomaterials with one or more molecules on its outer surface that target endothelial cells (e.g., molecules targeting ICAM-1, VCAM-1, E-selectin, P-selectin, or RGD tripeptide, or any of the target endothelial molecules described in Kowalski et al., *IUMB Life* 63:648-658, 2011). In some embodiments, the compositions are formulated as an emulsion or as a liposome-containing composition. In some embodiments, the compositions are formulated for sustained release (e.g., formulated in a biodegradable polymers or in nanoparticles). In some embodiments, the compositions are formulated in an implantable device that allows for sustained release of the oligonucleotide that decreases the expression of Map4k4 mRNA in a mammalian endothelial cell and/or a cholesterol-improving therapeutic agent.

Pharmaceutical compositions are formulated to be compatible with their intended route of administration or the intended target tissue, e.g., systemic or local administration. In some embodiments, the composition is delivered to an inflamed tissue in the mammal (e.g., by intramuscular, subcutaneous, intraperitoneal, or intrathecal injection) or a blood or lymph vessel (e.g., intraarterial, intravenous, or intralymphatic administration). In some embodiments, the compositions are formulated for oral, intravenous, intradermal, subcutaneous, transmucosal (e.g., nasal sprays are formulated for inhalation), or transdermal (e.g., topical ointments, salves, gels, patches, or creams as generally known in the art) administration. The compositions can include a sterile diluent (e.g., sterile water or saline), a fixed oil, polyethylene glycol, glycerine, propylene glycol, or other synthetic solvents; antibacterial or antifungal agents, such as benzyl alcohol or methyl parabens, chlorobutanol, phenol, ascorbic acid, thimerosal, and the like; antioxidants, such as ascorbic acid or sodium bisulfite; chelating agents, such as ethylenediaminetetraacetic acid; buffers such as acetates, citrates, or phosphates; and isotonic agents, such as sugars (e.g., dextrose), polyalcohols (e.g., manitol or sorbitol), or salts (e.g., sodium chloride). Liposomal suspensions

can also be used as pharmaceutically acceptable carriers (see, e.g., U.S. Pat. No. 4,522,811; herein incorporated by reference). Preparations of the compositions can be formulated and enclosed in ampules, disposable syringes, or multiple dose vials that prevent exposure of the caged tamoxifen or caged tamoxifen derivative molecules to light. Where required (as in, for example, injectable formulations), proper fluidity can be maintained by, for example, the use of a coating such as lecithin, or a surfactant. Absorption of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell and/or a cholesterol-improving therapeutic agent can be prolonged by including an agent that delays absorption (e.g., aluminum monostearate and gelatin). Alternatively, controlled release can be achieved by implants and microencapsulated delivery systems, which can include biodegradable, biocompatible polymers (e.g., ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid; Alza Corporation and Nova Pharmaceutical, Inc.).

Where oral administration is intended, the agents can be included in pills, capsules, troches and the like, and can contain any of the following ingredients, or compounds of a similar nature: a binder, such as microcrystalline cellulose, gum tragacanth, or gelatin; an excipient, such as starch or lactose; a disintegrating agent, such as alginic acid, Primo-gel, or corn starch; a lubricant, such as magnesium stearate; a glidant, such as colloidal silicon dioxide; a sweetening agent, such as sucrose or saccharin; or a flavoring agent, such as peppermint, methyl salicylate, or orange flavoring.

The compositions described herein can be formulated for ocular or parenteral (e.g., oral) administration in dosage unit form (i.e., physically discrete units containing a predetermined quantity of active compound for ease of administration and uniformity of dosage). Toxicity and therapeutic efficacy of compositions can be determined by standard pharmaceutical procedures in cell cultures or experimental animals. One can, for example, determine the LD₅₀ (the dose lethal to 50% of the population) and the ED₅₀ (the dose therapeutically effective in 50% of the population), the therapeutic index being the ratio of LD₅₀:ED₅₀. Compositions that exhibit high therapeutic indices are preferred. Where a composition exhibits an undesirable side effect, care should be taken to target the composition to the site of the affected or targeted tissue (the aim being to minimize potential damage to unaffected cells and, thereby, reduce side effects). Toxicity and therapeutic efficacy can be determined by other standard pharmaceutical procedures.

In some embodiments, the compositions described herein are formulated in a single dosage form. In some embodiments, a single dosage of the composition contains between 1 mg to 500 mg, between 1 mg and 400 mg, between 1 mg and 300 mg, between 1 mg and 250 mg, between 1 mg and 200 mg, between 1 mg and 100 mg, and between 1 mg and 50 mg of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell.

In some embodiments, a single dosage of the composition contains between 1 mg to 500 mg, between 1 mg and 400 mg, between 1 mg and 300 mg, between 1 mg and 250 mg, between 1 mg and 200 mg, between 1 mg and 100 mg, and between 1 mg and 50 mg of an anti-inflammatory agent and/or between 1 mg to 500 mg, between 1 mg and 400 mg, between 1 mg and 300 mg, between 1 mg and 250 mg, between 1 mg and 200 mg, between 1 mg and 100 mg, and between 1 mg and 50 mg (each) of one or more of a cholesterol-improving therapeutic agent, a fibrate, a nicotinic acid, a bile acid sequestrant, an omega-3 oil supplement, and/or an anti-platelet drug or blood thinner.

Also provided herein are kits that contain at least one dose of any of the compositions described herein. In some embodiments, the kits can further include an item for use in administering a composition (e.g., any of the compositions described herein) to the mammal (e.g., a syringe, e.g., a pre-filled syringe). In some embodiments, the kits contain one or more doses (e.g., at least two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen, fourteen, twenty, thirty, or forty doses) (e.g., oral or subcutaneous doses) of any of the compositions described herein. In some embodiments, the kit further contains instructions for administering the composition (or a dose of the composition) to a mammal (e.g., a mammal having inflammation or any of the inflammatory disorders or vessel fluid leakage disorders described herein). In some embodiments, the kits contain a composition containing at least one oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell (e.g., any of the oligonucleotides described herein), and a composition containing at least one of a cholesterol-improving therapeutic agent (e.g., any of the cholesterol-improving agents described herein), a fibrate, a nicotinic acid, a bile acid sequestrant, a omega-3 oil supplement, and/or an anti-platelet drug or blood thinner. In some embodiments, the kit further contains instructions for performing any of the methods described herein.

Screening Methods

Also provided herein are methods of identifying a candidate agent useful for decreasing leukocyte extravasation from a lymph or blood vessel into a tissue in a mammal or decreasing fluid leakage from a lymph or blood vessel in a mammal. These methods include providing a mammalian (e.g., human) endothelial cell, contacting the mammalian endothelial cell with a candidate agent, determining a test level of Map4k4 expression in the mammalian endothelial cell, comparing the test level of Map4k4 expression in the mammalian (e.g., human) endothelial cell to a reference level of Map4k4 expression in a control mammalian (e.g., human) endothelial cell untreated with the candidate agent, and identifying a candidate agent that results in a test level of Map4k4 expression that is lower than the reference level of Map4k4 expression as being useful for decreasing leukocyte extravasation or fluid leakage from a lymph or blood vessel into a tissue in a mammal.

In some embodiments, the mammalian (e.g., human) endothelial cell is in vitro. Some embodiments where the mammalian endothelial cell is in vitro further include administering the selected candidate agent to an animal model of inflammation (e.g., any of the animal models of inflammation described herein or known in the art), an animal model of an inflammatory disorder (e.g., any of the animal models of an inflammatory disorder described herein or known in the art), or an animal model of a vessel fluid leakage disorder (e.g., any of the animal models of a vessel fluid leakage disorder described herein or known in the art).

Non-limiting examples of animal models of inflammation are described in Stevenson et al., *In Vivo Models of Inflammation*, Birkhauser Verlag, Boston, Mass., 2006. Non-limiting examples of animal models of inflammatory disorders are described in Getz et al., *Arteriosclerosis, Thrombosis, and Vascular Biol.* 32:1104-1115, 2012; and Dixon, *Springer Seminars in Immunopathol.* 14:103-104, 1992. Non-limiting examples of animal models of vessel fluid leakage disorders are described in Kanter et al., *Plast. Reconstr. Surg.* 85:573-580, 1990; and Henriques et al., *Braz. J. Med. Bio. Res.* 20:243-249, 1987.

In some embodiments, the mammalian endothelial cell is in a mammal, and the contacting is performed by adminis-

tering the candidate agent to the mammal (e.g., by oral, subcutaneous, intravenous, intraarterial, intraperitoneal, intramuscular, interlymphatic, or intrathecal administration).

In some embodiments, the test level and the reference level of Map4k4 expression is a level of Map4k4 protein (e.g., SEQ ID NO: 1, 3, 5, 7, or 9). In some embodiments, the test level and the reference level of Map4k4 expression is a level of Map4k4 mRNA (mRNA encoding Map4k4 protein, e.g., SEQ ID NO: 2, 4, 6, 8, or 10).

In some embodiments, the reference level of Map4k4 expression is a level of Map4k4 expression of a control, in vitro, mammalian endothelial cell untreated with the candidate agent. In some embodiments, the reference level of Map4k4 expression is a level of Map4k4 expression of a control in vivo mammalian endothelial cell untreated with the candidate agent.

Methods for determining the level of Map4k4 protein expression are known in the art. For example, levels of Map4k4 protein expression can be determined using an antibody or an antigen-binding antibody fragment that binds to a Map4k4 protein (e.g., anti-MAP4K4 antibody from Abcam, Cambridge, Mass.; and MAP4K4 antibody from Epitomics, Burlingame, Calif.). In some embodiments, the amount of Map4k4 protein expression can be determined using an antibody or antigen-binding antibody fragment that binds to Map4k4 protein in an enzyme-linked immunosorbent assay (ELISA).

Methods for determining the level of Map4k4 mRNA expression are also known in the art. For example, levels of Map4k4 mRNA expression can be determined using polymerase chain reaction (PCR) techniques, including reverse transcriptase (RT)-PCR and real-time RT-PCR using primers that are complementary to a Map4k4 mRNA (see, e.g., the exemplary Map4k4 mRNAs described herein, e.g., SEQ ID NO: 2, 4, 6, 8, or 10). Additional sequences for mammalian Map4k4 mRNAs are known in the art.

Some embodiments of these methods further include generating a pharmaceutical composition for treating inflammation or treating an inflammatory disease or a vessel leakage disorder that includes the candidate agent.

The invention is further described in the following examples, which do not limit the scope of the invention described in the claims.

EXAMPLES

Example 1

Map4k4 Regulates the Expression of Leukocyte Adhesion Molecules in Endothelial Cells

Experiments to study the effect of Map4k4 activity on the expression of leukocyte adhesion molecules in endothelial cells were performed using human umbilical vein endothelial cells (HUVECs). In a first set of experiments, HUVECs were treated with 10 ng/mL TNF α for up to 60 minutes, and the expression and activity of Map4k4 was determined in lysates from the treated cells. The data show that 10 ng/mL TNF α induces Map4k4 activity in endothelial cells within 60 minutes (FIG. 1).

A further set of experiments was performed to determine whether Map4k4 expression has an effect on TNF α -mediated gene expression in endothelial cells. In these experiments, HUVECs were transfected with 25 nM of a scrambled (CAGTCGCGTTGCGACTGGTT; SEQ ID NO: 24) or Map4k4 (GACCAACTCTGGCTTGTATT; SEQ ID NO: 19) siRNA (purchased from Dharmacon), and

were either left untreated or treated with 10 ng/mL TNF α for 3 or 6 hours. The data show that Map4k4 mediates the TNF α -induced expression of CXCL2, CX3CL1, TNFAIP3, IL-8, SLC7A2, ICAM-1, MIRHG2, VCAM-1, and E-selectin in endothelial cells (FIG. 2). Additional experiments were performed to check the effect of Map4k4 siRNA on TNF α -induced Map4k4, ICAM-1, VCAM-1, and E-selectin mRNA expression. The data from these experiments show that Map4k4 siRNA effectively reduces Map4k4 mRNA expression in HUVECs (control data shown in FIG. 3), and that Map4k4 mediates the TNF α -induced increase in ICAM-1, VCAM-1, and E-selectin mRNA expression in endothelial cells (see, FIGS. 4-6).

The effect of Map4k4 on the TNF α -induced stimulation of ICAM-1, VCAM-1, and E-selectin protein expression in HUVECs was also studied. In these experiments, HUVECs were again transfected with either 25 nM of scrambled or Map4k4 siRNA, and were left untreated or treated with 10 ng/mL TNF α for 3 or 6 hours. The data from these experiments show that Map4k4 mediates the TNF α -induced increase in ICAM-1, VCAM-1, and E-selectin protein expression in endothelial cells (see, FIGS. 7-10).

The above data show that an agent that decreases the expression of Map4k4 mRNA in endothelial cells can prevent the expression of leukocyte adhesion molecules on the surface of endothelial cells, and that such an agent may decrease the binding of leukocytes (e.g., monocytes) to endothelial cells exposed to inflammatory stimuli. An additional set of experiments was performed to determine whether decreasing Map4k4 expression would decrease the amount of TNF α -induced monocyte binding to endothelial cells. In these experiments, HUVECs were transfected with 25 nM scrambled or Map4k4 siRNA, left untreated or treated with 10 ng/mL TNF α for 3 or 6 hours, and then contacted with calcein AM-labeled THP-1 monocytes for 30 minutes at 37° C. The endothelial cells were then washed and the number of adherent monocytes were imaged using fluorescent microscopy. The data show that endothelial cells with decreased Map4k4 expression demonstrated a significant decrease in the ability to bind monocytes (FIG. 11).

Example 2

Endothelial Map4k4 Knock-Down Mice Demonstrate Decreased Leukocyte Adhesion Molecule Expression in Endothelial Cells

Endothelial Map4k4 knock-down mice were generated to further study the effect of Map4k4 expression and activity on leukocyte adhesion molecule expression in endothelial cells. The endothelial Map4k4 knock-down mice were generated by crossing Cg-Tg (Cdh5-cre) 7MLia/J (VE Cadherin-Cre) mice (The Jackson Laboratory, Bar Harbor, Me.) with shMap4k4 mice (genetic constructs shown in FIG. 12). In a first set of experiments, primary lung endothelial cells and primary lung fibroblasts were isolated from control (Map4k4 sh) and the endothelial Map4k4 knock-down (Map4k4 sh-cre) mice, and the levels of Map4k4 mRNA were assessed using quantitative RT-PCR.

The data show that Map4k4 mRNA levels were significantly decreased in the lung endothelial cells of the endothelial Map4k4 knock-down mice (FIG. 13). The expression levels of Map4k4 protein in primary lung endothelial cells and primary lung fibroblasts in control (Map4k4 sh) and endothelial Map4k4 knock-down (Map4k4 sh-cre) mice were also assessed by performing Western blots. The data from these experiments show that Map4k4 protein is also

29

decreased in primary lung endothelial cells from the endothelial Map4k4 knock-down mice (FIGS. 14 and 15).

A further set of experiments was performed to study the expression of leukocyte adhesion molecules in primary lung endothelial cells from the endothelial Map4k4 knock-down mice. In these experiments, primary lung endothelial cells from the control (Map4k4 sh) and the endothelial Map4k4 knock-down mice (Map4k4 sh-cre) were left untreated or were treated with 10 ng/mL TNF α for 6 hours, and the expression levels of ICAM-1, VCAM-1, E-selectin, and P-selectin mRNA was assessed using quantitative RT-PCR. The data from these experiments show that the TNF α -induction of ICAM-1, VCAM-1, E-selectin, and P-selectin was significantly decreased in lung primary endothelial cells from the endothelial Map4k4 knockout mice (see, FIGS. 16-19, respectively).

These data indicate that Map4k4 expression and activity play a role in mediating an increase in the expression of several leukocyte adhesion molecules in mammalian endothelial cells in response to inflammatory stimuli.

Example 3

The Role of Map4k4 in the Permeability of Endothelial Cell Monolayers

A set of experiments was performed to investigate the role of Map4k4 expression and activity in the permeability of endothelial cell monolayers. In these experiments, HUVECs were transfected with 25 nM scrambled or Map4k4 siRNA, seeded onto porous collagen-coated Transwell chambers, and allowed to grow into a confluent monolayer for 72 hours. Once the HUVEC cells had reached confluence, they were left untreated or were treated overnight with 10 ng/mL TNF α . After TNF α treatment, FITC-labeled dextran was added to the upper chamber of the Transwell apparatus, and the amount of labeled dextran present in the bottom chamber was measured after 20 minutes using a fluorescent plate reader. The data from these experiments show that a decrease in Map4k4 expression decreases the permeability of an epithelial cell monolayer (FIG. 20). These data indicate that an agent that decreases the expression of Map4k4 mRNA in an endothelial cell would decrease fluid leakage from a blood or lymph vessel lined with endothelial cells.

Example 4

The Role of Endothelial Map4k4 Expression in Glucose Tolerance

A further set of experiments were performed to study the effect of endothelial cell Map4k4 expression on glucose tolerance in mice. In these experiments, control and the

30

endothelial Map4k4 knock-down mice were fed a chow or high fat diet (HFD) for 17 days (post-weaning), fasted overnight, and then intraperitoneally injected with 1 g/kg D-glucose. Blood glucose levels were then determined in the mice at 0, 15, 30, 60, 90, and 120 minutes after injection. The data show that the endothelial Map4k4 knock-down mice demonstrated greater glucose tolerance than control mice placed on the same diet (chow or high fat diet) (FIG. 21). These data indicate that Map4k4 expression in endothelial cells plays a role in glucose metabolism and uptake pathways, and an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell can be used to improve (increase) glucose tolerance in a mammal (e.g., a human, such as a human having type I or type II diabetes).

Example 5

The Role of Map4k4 in the Formation of Atherosclerotic Plaques

Experiments were performed to study the effect of endothelial cell Map4k4 expression on the formation of atherosclerotic plaques in blood vessels in mice. In these experiments, control ApoE-/- mice or ApoE-/-/Map4k4 knock-down mice were fed a Western diet for 8 weeks. The mice were then euthanized, and their aortas examined using light microscopy. Light microscopic images indicate that the aorta of a control ApoE-/- mouse had more atherosclerotic plaques (lesions) compared to a ApoE-/-/Map4k4 knock-down mouse (FIG. 22). Light microscopic images of the aortic roots of a control ApoE-/- mouse or an ApoE-/-/Map4k4 knock-down mouse stained with Oil-Red-O also show that the aorta of the control ApoE-/- mouse had an increased number (and size) of atherosclerotic plaques compared to the ApoE-/-/Map4k4 knock-down mouse (FIGS. 23 and 25). The mean percentage of the total aortic root area covered by atherosclerotic plaques (lesions) was also increased in the control ApoE-/- mice as compared to the ApoE-/-/Map4k4 knock-down mice (FIGS. 24 and 26).

These data indicate that administration of an oligonucleotide that decreases the expression of Map4k4 mRNA in an endothelial cell would decrease the formation of atherosclerotic plaques in a mammal, and would also treat atherosclerosis in a mammal.

45

OTHER EMBODIMENTS

It is to be understood that while the invention has been described in conjunction with the detailed description thereof, the foregoing description is intended to illustrate and not limit the scope of the invention, which is defined by the scope of the appended claims. Other aspects, advantages, and modifications are within the scope of the following claims.

The invention claimed is:

1. A method of reducing formation of atherosclerotic plaques in a blood vessel in a mammal, the method comprising:

identifying a mammal having atherosclerosis; and administering to the identified subject an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to decrease the expression of Map4k4 in an endothelial cell that lines a lumen of a blood vessel in the identified mammal, thereby reducing extravasation of leukocytes from the lumen of the blood vessel and reducing formation of atherosclerotic plaques in the blood vessel in the identified mammal.

2. The method of claim 1, wherein the mammal is a human.

3. A method of treating atherosclerosis in a mammal, the method comprising:

identifying a mammal having atherosclerosis; and administering to the identified mammal an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to decrease the expression of Map4k4 in an endothelial cell that lines a lumen of a blood vessel in the identified mammal, thereby reducing extravasation of leukocytes from the lumen of the blood vessel, and treating atherosclerosis in the identified mammal.

4. The method of claim 3, wherein the mammal is a human.

5. The method of claim 1, wherein the oligonucleotide is administered by intravenous or intraarterial administration.

6. The method of claim 1, wherein the oligonucleotide is an inhibitory RNA.

7. The method of claim 6, wherein the inhibitory RNA is a small inhibitory RNA.

8. The method of claim 1, wherein the oligonucleotide is 60 an antisense oligonucleotide.

9. The method of claim 1, wherein the oligonucleotide is a ribozyme.

10. The method of claim 1, further comprising administering to the identified mammal one or more additional agents useful for treating atherosclerosis selected from the group consisting of: an anti-inflammatory agent, an analgesic, a cholesterol-improving therapeutic agent, a fibrate, nicotinic acid, a bile acid sequestrant, an omega-3 oil supplement, an anti-platelet drug, and a blood thinner.

11. The method of claim 3, wherein the oligonucleotide is administered by intravenous or intraarterial administration.

12. The method of claim 3, wherein the oligonucleotide is an inhibitory RNA.

13. The method of claim 12, wherein the inhibitory RNA is a small inhibitory RNA.

14. The method of claim 3, wherein the oligonucleotide is an antisense oligonucleotide.

15. The method of claim 3, wherein the oligonucleotide is a ribozyme.

16. The method of claim 3, further comprising administering to the identified mammal one or more additional agents useful for treating atherosclerosis selected from the group consisting of: an anti-inflammatory agent, an analgesic, a cholesterol-improving therapeutic agent, a fibrate, nicotinic acid, a bile acid sequestrant, an omega-3 oil supplement, an anti-platelet drug, and a blood thinner.

17. A method of treating atherosclerosis in a mammal, the method comprising:

identifying a mammal having atherosclerosis; and administering to the identified mammal an oligonucleotide selected from the group of an oligonucleotide selected from the group consisting of an inhibitory RNA, an antisense oligonucleotide, and a ribozyme that decreases Map4k4 mRNA expression in an endothelial cell, in an amount sufficient to decrease the expression of Map4k4 in an endothelial cell that lines a lumen of a blood vessel in the identified mammal, thereby treating atherosclerosis in the subject.
